**WORKING PAPERS****Beyond the Ballot: Shareholder Engagement and Governance Dynamics**

with Andrey Malenko and Nadya Malenko (August 2026) [Latest version](#)

This paper studies how private engagement and public voting jointly shape shareholder governance. Using data on large asset managers' pay-related engagements and say-on-pay votes, we show that both channels respond to disagreement between investors and boards, and that engagement predicts lower future CEO compensation and less subsequent dissent. We develop and estimate a structural model in which engagement and voting are interacting governance channels that determine what investors and boards learn and how CEO pay evolves. The model shows why votes can be misleading in isolation: support for management can reflect concerns resolved through prior engagement, rather than shareholder passivity. It also allows us to evaluate recent regulatory initiatives that may restrict engagement or voting. Our counterfactuals show that restrictions on one channel shift investor activity toward the other, but substitution is incomplete: engagement allows richer information exchange, while voting also disciplines management.

**Human Capital, Competition and Mobility in the Managerial Labor Market**

with Noah Lyman and Lin Zhao (August 2026) [Latest version](#), [SSRN](#)

We pose a structural model of the managerial labor market with general and firm-specific human capital accumulation, internal and external mobility, managerial bargaining power, and imperfect labor market competition. The model reconciles high pay with low mobility: outside offers can improve incumbent contracts without producing job switches. Firm-specific skill is central to this mechanism: it strengthens incumbent matches, raising poaching costs and weakening the leverage of a given outside offer. Competition therefore operates through renegotiation with incumbents: bargaining power alone would give managers 31.6% of match surplus, while competition lifts realized capture to 54.6%, and to 79.3% for externally hired CEOs. Making firm-specific skill portable shifts competitive gains from renegotiation toward mobility, increasing job switching, external CEO hiring, and manager welfare.

## Shareholder Voice and Executive Compensation

(October 2026) [Latest version, SSRN](#)

I estimate a model of CEO compensation with advisory shareholder votes (Say-on-Pay). Because the Board sets pay anticipating dissent, the vote disciplines pay ex ante even though it is nonbinding. Removing the vote raises pay by 11.9% and lowers shareholder welfare by 0.51%, despite a 6% failure rate. I study two binding designs. Reversion restores the last approved policy after failure; revision adjusts the proposal using the vote's information. Relative to advisory voting, reversion lowers shareholder welfare because the Board controls both the proposal and the status quo; revision raises it by making vote-based information consequential for the current policy.

## Information and Preferences in Shareholder Voting

with James Pinnington and Lin Zhao (July 2026) [Latest version, SSRN](#)

We develop a structural model of shareholder voting under incomplete information about proposal quality. Preferences and information are not separately identified from individual voting patterns: correlated information and strategic voting jointly determine the mapping from preferences to votes. Our identification strategy uses proxy advisor recommendations as observable measures of public information and vote co-movement across shareholders to identify the information environment; preferences are then pinned down by the voting equilibrium. Despite higher support for management, blockholders' preferences towards passage of management proposals are close to dispersed shareholders': the gap reflects inference from pivotality. Differences in information quality affect voting outcomes more than differences in preferences.

## WORKS IN PROGRESS

### Executive Mobility in the United States, 1920-2023

with John Graham, Hyunseob Kim and Dawoon Kim (October 2026)

This paper studies the evolution of U.S. public corporations' executive mobility from 1920 to 2023. The executives' mobility exhibits a secular increase from the 1920s through the turn of the century. After peaking in the late-1990s, it declined sharply and stabilized at a lower level: chief executive mobility in the 2010s is less than half its late-1990s peak, returning to levels of the 1960s and 1970s. Finance-chief mobility shows a stronger secular rise over the century. We argue that changes in the size of the executive labor market, the redeployability of executive skills, and capital reallocation explain these trends. Using a shift-share design, we show that the mobility impacts executive pay structure.
